Tropical Weather Discussion

Special Tropical Weather Outlook
NWS National Hurricane Center Miami FL
730 AM EDT Fri May 25 2018

For the North Atlantic...Caribbean Sea and the Gulf of Mexico:

1. Satellite images and surface observations indicate that the low pressure system located over the northwestern Caribbean Sea just east of the Yucatan Peninsula of Mexico has become better defined overnight, and thunderstorm activity has also increased and become better organized. Environmental conditions are forecast to steadily become more conducive for development, and a subtropical or tropical depression or storm is likely to form by Saturday over the northwestern Caribbean Sea or the southeastern Gulf of Mexico. An Air Force Reserve reconnaissance aircraft is scheduled to investigate the low this afternoon.

Locally heavy rainfall is forecast across western Cuba and over much of Florida and the northern Gulf Coast into early next week. This system could also bring tropical-storm-force winds and storm surge to portions of the northern Gulf Coast by late this weekend or early next week. In addition, the threat of rip currents will steadily increase along the Gulf Coast from Florida westward to Louisiana over the Memorial Day weekend. For more information on these threats, please see products issued by your local weather office, and see High Seas Forecasts issued by the National Weather Service for information on gale warnings associated with this system. The next Special Tropical Weather Outlook on this system will be issued by 200 PM EDT today.

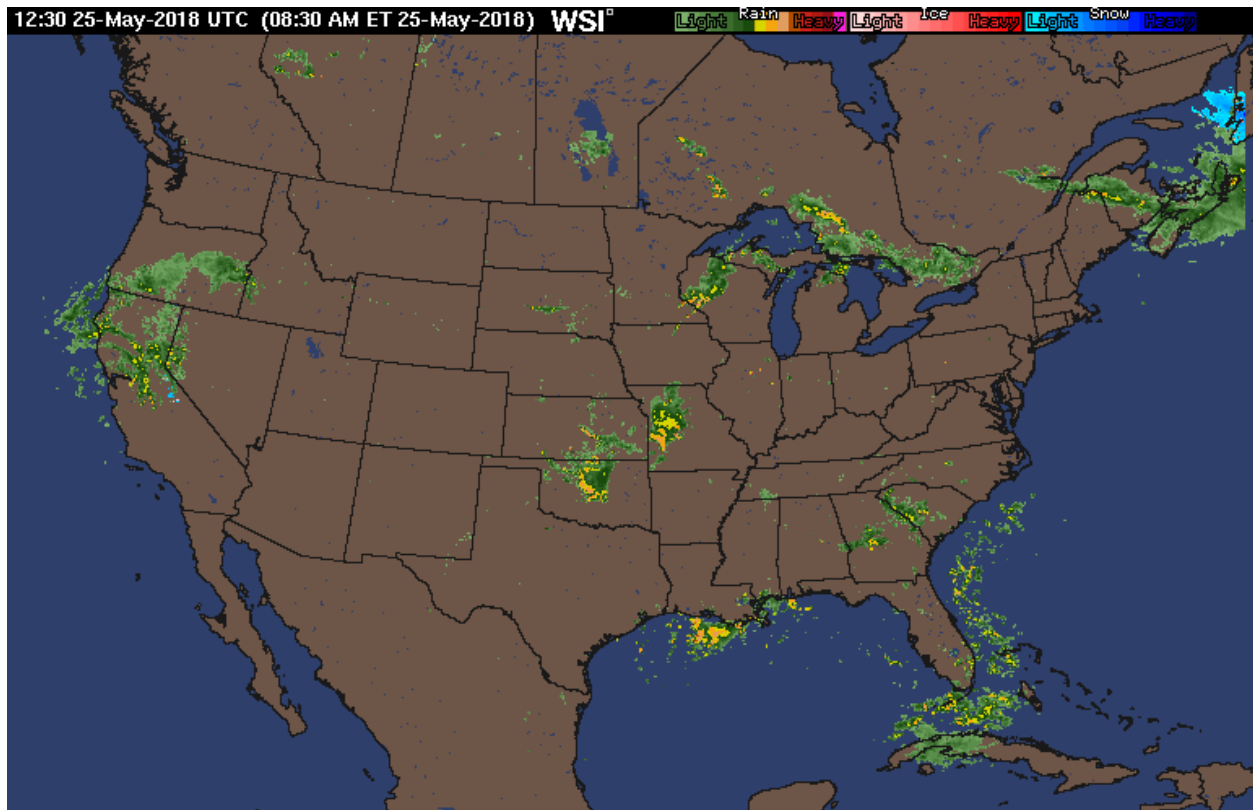

* Formation chance through 48 hours...high...90 percent.

* Formation chance through 5 days...high...90 percent.

High Seas Forecasts issued by the National Weather Service can be found under AWIPS header NFDHSFAT1, WMO header FZNT01 KWBC, and the Web at <http://ocean.weather.gov/shtml/NFDHSFAT1.shtml>.
